scrim

On this page: Dictionary

scrim

Dictionary

scrim (skrĭm)

n.

1. A durable, loosely woven cotton or linen fabric used for curtains or upholstery lining or in industry.
2. A transparent fabric used as a drop in the theater to create special effects of lights or atmosphere.

[Origin unknown.]

▼ *Continued below...*

Marketing Terms

BARRON'S

scrim

1. Gauzelike curtain used in theater, motion picture, and television presentations to give special lighting effects. When illuminated from one side, the material is translucent; when illuminated from the other side, it is opaque. Therefore, a scrim can be used to give the illusion of a wall; then, with a change in lighting, the audience can see the action going on behind the wall.
2. Translucent material used to diffuse or decrease the light intensity from a lighting instrument. Scrim is frequently used on scoops or other floodlights to heighten their soft light quality.

▼ *Continued below...*

WordNet

The *noun* scrim has one meaning:

Meaning #1: a firm open-weave fabric used for a curtain in the theater

▼ *Continued below...*

🔗 [Wikipedia](#)

scrim

A **scrim** or **gaze** is a very light textile made from cotton, or sometimes flax. Its light weight and translucence means it is often used for making curtains. The fabric can also be used for bookbinding and upholstery.

Scrim has also seen extensive use in theatre. The variety used for special effects is properly called *sharktooth scrim*. However, in theater a scrim can refer to any such thin screen, and are made out of a wide variety of materials. The advantage of scrims is that when lit from the front they can appear opaque to the audience, until a change in stage lighting (lighting from behind) makes them almost fully transparent. When lighting behind a scrim to make objects "appear" behind it, the scrim itself should not be lit, as it will detract from the translucency. Lighting to make the scrim appear opaque should be done at an oblique angle to the scrim. The general rule is anything lit behind the scrim (even lights that originate from the front) will be seen by the audience. Scrim has a rectangular weave that is similar in size in its openings to a window screen.

Scrim is not to be confused with bobbinette, an often used substitute. Bobbinette has a more open weave than Sharkstooth scrim, and therefore it is harder to hide the objects behind. Bobbinette also has a hex weave.

Scrim can also be used in theatre in combination with a cyclorama or backdrop. The idea is similar to the other uses. When the drop is lit (or images or video are rear-projected onto the back of the drop), the images or colours projected are visible. However when the drop is not lit, the images or colours will disappear. A scrim can also help dull the image, creating a greater sense of depth.

An undesirable effect is caused by layering two scrims, or even by placing a mirror behind a scrim and lighting it: the familiar moire effect. This can often cause audience disorientation.

(Moisture sorption and diffusion in polyacrylonitrile fiber : Interaction between nitrile groups and sorbed water)

Auteur(s) / Author(s)

FUKUDA M. ⁽¹⁾ ;

Affiliation(s) du ou des auteurs / Author(s) Affiliation(s)

⁽¹⁾ Textile Materials Science Laboratory, Department of Practical Life Studies, Hyogo University of Teacher Education, Yashiro-cho, Hyogo, 673-14, JAPON

Résumé / Abstract

Moisture sorption properties of polyacrylonitrile (PAN) fiber has been investigated. Sorption isotherm at 25°C and heat of wetting for PAN fiber were compared with those for acrylic fibers with known chemical compositions. The moisture regain at 65% r.h. was 1.37% (w/w) and heat of wetting for the dried PAN fiber was 0.6 cal/g, which were comparable values to those for the acrylic fibers. Diffusion of moisture into PAN fiber was observed using a gravimetric method at 25°C. The sorption/desorption curve below 70% r.h. was nearly identical, which indicated that interaction between water molecules and nitrile group in polymer chain was not significant. The results obtained in this study suggest that the averaged interaction between water and nitrile group is very weak. On the other hand, the exothermic property for heat of wetting and IR spectrum pattern for OH stretching indicated the possibility of the strong interaction between the sorbed water molecules and a very few nitrile groups.
